D.2 SAS

APPENDIX E: THESIS ADVICE FROM ECONOMICS SENIORS, Fall 2011-Spring 2012

I. INTRODUCTION

This Handbook is designed to help you with ECO 494 Senior Thesis Preparation, and Eco 495 Senior Thesis in Economics. It is a valuable resource; if you have any questions about it, you can ask in the ECO 494 class or ask your thesis advisor.

This Handbook draws heavily on similar Handbooks from the University of Akron and the College of Wooster.

http://gozips.uakron.edu/~myers/E226/curriculum/Senior_Project_Handbook.pdf

<http://www3.wooster.edu/economics/archive/is handbook.pdf>

II. PLANNING FOR THE THESIS TOPIC

Even before you take the senior thesis preparation course, start to think about the following:

- . What have you learned from your economics courses, theoretical, quantitative and applied? Rereading your papers and projects should be helpful.
- . Which assignments interested you most? Which readings might serve as a jumping-off point for your thesis topic? Look through the syllabi for courses you have taken.
- . What topics in economics news interest you?

You should start thinking about possible thesis topics in any upper-level course where a paper, or an article or some topic of discussion is especially appealing. By the Fall semester senior year, you will be enrolled in the senior thesis preparation course ECO 494. Your Thesis topic may require specific economic electives. You are encouraged to choose a topic that relates to courses you have taken; for example, it would be a mistake to try to pursue an international-economics topic if you have not yet taken International Trade. For the mathematically inclined and/or those headed to a PhD program, you may want to take extra statistics courses.

For everyone else, the thesis is a chance to .cook. with statistics. We have prepared a set of .recipes. for the kinds of econometric techniques often required by different kinds of datasets and economic problems, for both Stata and SAS (see Appendix B). Once you have specified your model, you will need to look at these. Often, OLS regression is not sufficient, you are likely to face well-known statistical issues that you will have to address through other techniques. If you have any statistical questions, feel free to consult your advisor or Prof. Samanta.

Selecting an appropriate research topic is one of the most important steps in the successful completion of the Thesis. First you need to consider the general area the project will cover: e.g. unemployment in the US; smoking among teenagers in the U.S., etc. Note that a research topic is a step further than the general area (e.g. Labor Economics, International Trade). You have to identify a research question that your thesis will hope to answer, e.g., to what extent does education level affect the probability of becoming unemployed, or does involvement in extracurricular activities reduce the probability of smoking. An effective strategy is to develop a

topic you have previously studied for a paper in another course, either a field course and/or Econometrics, or in a MUSE project. It definitely helps to have a topic which interests you and/or relates to an area in which you hope to be employed. These are great talking points for job interviews or graduate-school essays. Remember that your project will probably have a quantitative aspect and that is why a paper from ECO 420 or ECO 231 may be a good starting point since you may have already found a dataset for that project. Finding data successfully, downloading it, and cleaning it (more below) is a very important and time-consuming step in your thesis process.

Once you have determined a general research topic, you need to develop a specific research question, which is the topic of Step 1 of the research process, below.

III TIMELINE FOR THESIS

Planning for how to allocate your time during ECO 494 and ECO 495 will help you avoid the common mistake of underestimating how long each stage of the thesis will take. Here we discuss the steps in the thesis process, and provide a basic timeline for both semesters.

There are several requirements on the way to completing a Senior Thesis. (1) The Concept Paper (1-2 pp.) develops the research question, defines your specific research topic, and identifies the relevant literature and verifies data availability for your core variables. (2) The Thesis Prospectus expands on the Concept Paper, analyzes the literature, develops your hypotheses, specifies a model, and identifies the data sources you will use, especially for your key causal variable(s) and dependent variable. (3) The Thesis Proper builds on the Prospectus. It may involve further data collection and cleaning and ongoing model revision; statistical analysis and a first draft; improving the statistical analysis by additional techniques; re-writing several times to prepare the final Thesis paper; and the Oral Presentations. Each part needs to be completed in a timely fashion to allow you to finish an acceptable project in the time allotted. At the same time, one size does not fit all. For some students the data is readily available, for some there are many headaches in finding the data. Sometimes the data needs major cleaning, other times everything needed is available online. Some students have major headaches with the statistical aspect of their analyses, others do not. Some are quite comfortable writing up the statistical results, using published articles as a template, others need time and coaching to figure out how to explain their findings. So you should never feel like you are ahead of the game, because you do not know how much work awaits you at the next stage.

This is a major writing project and economists are not known for their writing, so as you prepare your thesis prospectus, read Deidre McCloskey's, *Economical Writing* and Strunk and White's *Elements of Style*, two slim volumes that are full of tips on good writing. Doing this reading in advance will help you when it comes to drafting and redrafting your thesis. You should rely on the *Chicago Manual of Style* as final arbiter of bibliographic and citation conventions.

Most of you will be doing your research using econometrics. It may be a year or more since you took that class and your skills may be rusty at best. You should review your notes and text on

regression for the kind of dependent variable you're using (time-series, cross-section, panel; level, percent, log, dummy variable) before the ECO 495 semester starts.

Spend some time thinking about the form of your model. Does your hypothesis suggest that the level of investment affects the level of GDP? Or that the level of investment affects the growth of GDP (think net investment)? Is the impact immediate, or will it be down the road (i.e., do you need to allow for lagged effects)? The exact form of the relationships depends on what questions you are trying to explore.

The following **Timeline is for the thesis-preparation semester**, ECO 494, Fall 2015:

Week I - IX Aug. 31 – Nov. 2	Meet with ECO 494 coordinator and other faculty Read various literatures, try to identify thesis topic Meet with economics faculty members to talk about your topic and get some ideas Identify your advisor and your basic topic
Week X Nov. 9	Submit Concept Paper to your advisor (this can be via email)
Week XIII Dec. 2	Submit initial Thesis Prospectus
Week XV Dec. 14	1st day of final exams, final Thesis Prospectus due,* incorporating advisor feedback on your first draft

*Meeting the deadline for the Thesis Prospectus is essential, since you will not be signed into ECO 495 if you have not completed a satisfactory Thesis Prospectus.

The following **Timeline for the senior-thesis semester** has been developed to assist you; your advisor may modify these deadlines, Spring 2016:

Week I	Jan 25	Completed Prospectus: Lit Review, Model, basic data ideas Revise model, work on dataset
Week II	Feb 1	Your complete dataset, correlation matrix, model revisions Table/plot of stylized facts for variables (plot if time-series)
Week IV	Feb 15	Initial econometric runs, extended data, further model modifications
Week VI	Mar 1	Economics Field Exam sometime in this vicinity
Week VII	Mar 8	Start writing thesis: Revised Lit review, focused on your final topic Copy statistical results to Excel for final tables Discussion of econometric results – tie to main hypotheses

Week IX	Mar 29	File request to be excused from class for Ursinus Conference In mid-April Complete first draft.* This includes: Lit review, final draft Table of stylized facts for your dependent & explanatory variables (mean, SD, trend/changes over time if appropriate) Preliminary econometric results Write-up of econometric results Bibliography
Week X	Apr 5 Apr ?	Thesis draft # 2, including additional statistical work if necessary If accepted by advisor, <u>Submit your approved first draft to the Ursinus Conference online</u> Prepare your discussant comments on another student's paper
Week XI	Apr 12	Prepare PowerPoint presentation for Ursinus – as if you're teaching a class
FRIDAY APRIL 14?		URSINUS CONFERENCE: OMICRON DELTA EPSILON UNDERGRADUATE ECONOMICS CONFERENCE, COLLEGEVILLE PA Meet at Student Center parking circle near the sundial at 6:30 am Present your paper, respond to questions
Week XII	Apr 19	Complete revised draft, based on advisor comments and what you figured out from your Ursinus presentation, discussion and discussant comments
Week XIV	May 3	Thesis "defense" - present to economics faculty & your friends at TCNJ Celebration of Student Achievement
Week XV	May 10	First day of final exams, Final Thesis due

*Completing the first draft of the Thesis in a timely manner is essential so it can be sent to your discussant at the Ursinus Conference in advance. This is part of your final thesis grade.

IV. DISCUSSION OF STEPS OF THE RESEARCH PROCESS

Most of part IV has been taken from the University of Akron Department of Economics (2011); see also the College of Wooster (2012) and Greenlaw (2006).

Step 1: Developing an Effective Research Question

You cannot set up a research hypothesis without a carefully defined research question. The

research question .is the specific focus of the research.. For example: .How do different levels of education affect unemployment rates?. Setting up a good research question is one of the hardest parts of your project. A good research question is:

/. Problem oriented

- . Analytical (rather than descriptive): you want to explain something
- . Interesting theoretically or from a policy perspective, and meaningful
- . Amenable to economic analysis
- . Feasible (is the data available?)

Your question should relate to why? How? And so what? You need to address a problem, to find a piece missing on a topic, an unanswered question (a gap), preferably with policy relevance. It needs to be interesting and significant to you and to your audience (so what?). Your question should be analytical rather than purely descriptive: Your question should try to explain, not just try to describe. It is relevant to see if data indicating two variables are related, but it is much more important to determine why. You may find that a high percentage of redheaded students pass economics (descriptive), but the analytical question is why?

An additional important aspect of your research question is that it has to involve an economic problem. What is an economic problem? An economic problem typically involves the production and/or distribution of goods and services, including inputs. Ask yourself if the problem that interests you relates to decisions under constraints? To supply and demand? To people acting in their self-interest? To the unanticipated consequences of individual choices? Some problems may only involve physical or psychological variables, for example: Why does an apple fall downward? Why do children rebel? These are not problems with an economic dimension.

Finally and necessarily: a question has to be answerable in the time available. Many students want to tackle questions which are too complex to do in one semester, or they cannot find data to answer their questions, or they find so much data they are overwhelmed by it. Remember that economists do not in most cases collect their own data and that an appropriate dataset may not be available, that some datasets are proprietary, that aspects of the dataset may make it impossible to use in SAS or Stata. This means you need to check out data availability and accessibility at the same time as you are developing your topic for the Thesis Prospectus.

If at first you don't succeed, try, try again. Our past students have found research questions. Sometimes they have had to accept that they may need to take someone else's question and use it on slightly different data. But some have identified a significant gap and have found an imaginative way to fill it, using unusual datasets. You have old Theses on the Department website to give you examples.

Step 2: Surveying the literature on the topic

In this step you present a review and critique of the scholarly literature relevant to your research. Your planned research is the focus of this review. The most important thing to remember is that you are telling a story that needs to flow and hold together. It's a narrative that

starts with what is known about your topic, relates it to the major studies and their findings up to the present and evaluates critically how well the authors relate their conclusions to their findings. Finally, you point out gaps in the analysis of the topic and how your work will fill in at least one of those gaps: how it will add to the literature. You have then explained what leads to your question and identified your own hypothesis. This section may be viewed as a presentation of the current state of knowledge regarding your topic: What unanswered questions remain in the literature which, perhaps, your study can answer? Is there some causal variable that has not been included by the literature? What can your study do better than what's already been done? In addition, the literature review can serve as a guide to how previous researchers have employed theories similar to yours and how they have made these theories operational for empirical testing.

To accomplish this narrative effectively, you need to understand the relationships clearly so you can explain them to others. If you do not understand what an article is saying, ask your advisor for help. Do not try to summarize what does not make sense to you, it will show. For empirical literature, be specific about their precise dependent variable and the kind of data they used – survey data, time-series (what years?), cross-section (by state? Country?), panel data (what years and states/countries)?

A lack of flow suggests that you really do not see how it all relates. Students also often develop literature reviews that are too narrow or too broad. If too narrow, they just include articles that relate directly to the chosen research question, and perhaps not even all of those, because they have not looked hard enough! Assume there is a literature out there, and be tenacious about trying to track it down, even if in non-economics journals; some students have used medical journals or non-economics social-science journals. There may also be useful research on a similar question that uses an effective model that could be adapted to study your question. We expect at least 10 relevant economics or other scholarly sources for the literature review. When a literature review is too broad, it includes everything you reviewed on the general topic even if it was not relevant to the research question

Developing the literature review is time-consuming and you will need advice. Plan to be in communication with your thesis advisor.

Step 3: Analyzing the issue or problem

At the end of this step, you will have defined your research hypothesis or hypotheses; an essential step before your empirical analysis. The research hypothesis is the proposed answer to the research question or the researcher's principal assertion about the topic.[are you quoting someone? If so give citation, showing students how it is done. If not, now quotation marks]. It is the assertion that the paper will address. The hypothesis should be no more than one sentence and be very specific. It must be something that data can either support or refute. For example,

I will test to see if the level of criminal activity in a state decreases with more severe penalties against such activity.

To reach your hypothesis you need to determine which economic theory or theories are

relevant to your research question. This means using the knowledge of basic micro and macro theory you have obtained from your courses and also applying the theory used by others that you have developed in your literature review. Typically, the steps you then need to take:

- . What are the essential economic concepts in the problem you are researching?
- . How are the concepts related?
- . What logical prediction or predictions can be made from these relationships? Often students work backwards, which is ok. They come up with a hypothesis, and then have to step back and think about how this fits with economic theory more broadly speaking.

The next step is to develop an appropriate model incorporating the theory or theories, setting out the assumptions, identifying the variables involved and making logical predictions that relate to your problem. The model must be clearly described and include all the relevant variables.

It is essential that you base your hypothesis on theoretical analysis, otherwise you cannot make statements suggesting cause and effect: at best you can only report correlation. For example, for the criminal-activity hypothesis stated above the theory behind that hypothesis would be based on individual decision-making, whereby s/he compares the benefits and costs of criminal activity at the margin. You would find models based on that theory in any articles on the economics of crime.

Finally, it is important to recognize that you must have appropriate data with appropriate variability to test your hypothesis.

Step 4: Testing your analysis

The Data

A former student warns that data collection is .difficult, tedious and time-consuming. and that you must .start early.. He is right. You may have a great hypothesis but you may not be able to find the data to measure all the variables, or in particular, your crucial explanatory variable. Alternatively, you may find some data and learn that it is not available free or that is very difficult to download or it is confidential.

Before you search you need to remember that you need an adequate sample size with appropriate statistical properties - that is randomness. You need to determine what variables you need and for what time period. Even in a cross-section study, you will gain degrees of freedom if you can include data from multiple periods .

Where to look for data? It is easier to obtain macro data sets than micro sets, although there are large micro-sets available in a number of fields. You should be able to track down those datasets in fields you have studied, or in published articles in the fields. Nevertheless tenacity is essential and the patience to follow all leads. Sometimes even basic data can temporarily be missing from the web (e.g., unemployment rates for 1997 by state were down one year for more

than a week). In some cases, e.g., if you create data by administering a survey, privacy issues are involved and you must have Institutional Review Board approval, which may take several weeks. If you do not plan to publish your thesis results, an expedited review is possible. If you would like to publish them, you will need a couple of months lead time! You can see why starting early is essential.

You may want to use a dataset actually used in a published study: you can ask the authors for permission to use that data or for suggestions on how to obtain it. To have the best chance of a reply, ask a faculty member to send your request, adding their explanation of the Department's Thesis requirement to the message.

Remember, you may not find data that is totally relevant, and/or all the variables you want, certainly in one dataset. Then you have to modify: to incorporate data from more than one dataset, to modify your variables, even modify your model. You will then have to make clear in your study what changes and assumptions you had to make and explain in your judgment why the data are relevant to test the hypothesis. The test is whether the data set is .large, rich and accurate enough to adequately test the hypothesis..

Once you have located seemingly adequate data, you need to explore it. (Warning: You may find it is very difficult to access.) You need to download it into SAS or Stata for data manipulation and variable creation. This may involve another time-consuming process. You will be tempted to try to get around using SAS for everything. Remember the quote in the introduction: it is skill with SAS that many employers want.

Data preparation includes data cleaning. As you have been warned in econometrics, make sure you have done your best to deal with issues like missing data and errors in the data. For some data sources, this verification of the extent to which your relevant variables are available for all cases can be very time-consuming. For instance, some states may simply not publish the data you seek. You need to know that this is not then a 50-state study, and say so. Sometimes you have to aggregate individual data, say for the hospitals in a state, into a state measure, so you can use other state-level variables (e.g., income) in your model. This can all be very time-consuming.

Finally, you have to spend time thinking about what form of your variables you want to use. For instance, it is unacceptable to run purely nominal GDP measures as your dependent variable, when your theory seeks to explain real GDP. Is the growth of sales dependent on the number of unemployed, or the unemployment rate? U-3 or U-6? To explain per capita cigarette consumption, do you want aggregate GDP, personal income, disposable income, or disposable income per capita? In cross-national studies, you would want to compare comparables, so measure everything in the same currency unit. When data is scarce, you may have to be creative in developing measures. Be sure to control for common explanatory variables.

It is best to start thinking about these questions for the Prospectus, before you gather all your data, but for many students these questions continue to come up as they start to run regressions. Logic is your friend, think about what makes sense *a priori*. You may also have to think about the third-variable or excluded-variable problem: ask yourself, are they any crucial controls or

other determinants of your dependent variable that are missing from your model? Be clear in your head about which are causal variables, and which are descriptive (e.g., demographic controls).

Once you have a workable, cleaned-up, logical dataset and model, your objective is to produce a clear table of descriptive statistics, as required in Econometrics class. The table of means and standard deviations will be included as a table in the data section of your thesis. Pairwise correlations among all your regressors and dependent variable will help you start to anticipate econometric relationships. See Appendix A to this document for an example.

Empirical Testing and Analysis

In this step, you are actually carrying out the statistical tests of your hypothesis. [Although most of you will probably choose an econometric project, it is perfectly acceptable To use other analytical techniques, such as those in game theory.] You have a number of things to consider. First how well does the econometric model you use reflect the economic model you developed in Step 3 and how well do the econometric variables relate to the variables called for by the theory behind your empirical setup. You have had to make modifications because of data problems: you will have to be able to justify them effectively.

You have to decide what statistical technique adequately tests your hypothesis. In most cases you will start with Ordinary Least Squares (OLS), but in many cases that model is not really appropriate. You may need to go beyond it to find a relevant estimation technique. You may even have to learn new techniques . Certainly you will find your initial results will be inadequate and you may have problems with issues like multicollinearity and specification error that require modifications of your model. In addition you will also need to test to see if your results are robust to changes in specification. All of this means thinking carefully, keeping your econometrics text beside you and getting feedback from your advisor(s) - and it involves lots of time!

Note again that the output from this step needs to be clear professional-looking tables of the variables and models that present your final, appropriate results and statistical tests. This is the material you will be interpreting in the next step. Do not use your unmodified SAS output and do not express data to more than a few decimal points of non-zero entries.[Stata statistical output can be copied into Excel by copying in two steps: first the table containing summary statistics (R-squared, etc.), then the table with the coefficient estimates, etc. In each case choose .copy table. when copying from Stata, then .Paste Special. and .Unicode text. in Excel. You can then eliminate extra columns before copying these results into a Word document.]

If you are using a methodology other than regression analysis, this section should provide a detailed description of how you will be testing your hypotheses, or developing your idea or application. Your analysis and results (sometime quantitative and sometimes not) should follow.

Step 5: Interpreting the results and drawing conclusions

In this step, you are interpreting your results, that is, explaining what they mean. You would usually start with the coefficients: What does each coefficient signify? Be specific. For example, if you have a log/log demand model and the coefficient for product price is .003, it indicates that a 1% increase in price would decrease quantity by .003%, other factors constant. You need to explain the statistical properties clearly: if it is .highly significant. what does this actually mean? You also need to make clear the economic or social significance of your results, as distinct from statistical significance: e.g. if the price elasticity of demand is .003 and statistically significant at the 1% level, price still has virtually no effect on quantity. When evaluating coefficients, you also need to note and explain unexpected results: results where the signs are unexpected. Finally, what does goodness-of-fit mean to the results and to the hypothesis.

You need to go on to discuss what the problems with your model and data are and the limitations they have on your results.

You should then draw together the theoretical and/or empirical findings and set out your conclusions. You should specifically determine whether the hypotheses were supported or not, and point out the implications of your findings both for our understanding of economic phenomena and for policy recommendations. You should be honest about how limitations on the data or constraints on your model lead you to caution the reader not to draw too strong an inference from your findings.

Finally you should discuss how you would improve your study and go further to suggest specific future research avenues on your topic.

Step 6: Communicating the findings of the research process

So now you have developed results for your project and you think it's done. However, you've still got the most important part to go: communicating those results. Good writing is essential to that process and it is not easy, so you should get all the advice you can on the process.

In the evaluation we have developed questions related to these issues under Organization, Argumentation and Quality of Writing. If your advisor gives you detailed, incorporate every single suggestion, unless you have good reason to take issue on a particular point.

Organization means meeting the requirements of an appropriate title page, table of contents, abstract — all the way to references in appropriate form, correct citations, and all needed Appendices. See the next section for further details on the organization of the final paper.

Argumentation is about building a persuasive argument. It starts with a clear thesis (research question and research hypothesis) and then builds the argument in an .organized and solidly developed (cite). manner. This is where you need to organize your main points in a logically hierarchical order, making sure you do not have missing links in the argument or have material that is irrelevant. To achieve a clear argument, one strategy is to make a paragraph outline ; this also leads to paragraphs with topic sentence and then an explanation of the idea. Alternatively, write everything on your mind down, then stand back and outline what you've

written. Evaluate that material, and reorganize it into a coherent outline that provides a chain of thought that avoids repetition and explains all the relevant ideas. Either way is an effective method for giving a flow to your report. Be sure you understand and are clear about what your argument is: your evaluators can tell when you do not.

Quality of writing is a matter of being .clear, precise and concise (cite).: of being professional. The most important thing is to be clear. If someone reads your work and cannot quite understand it, it lacks clarity. To write clearly, you should start sentences with a subject then a verb, preferably using a strong verb. While first drafts are often full of gerunds and extra verbs, tighten up your draft by trying to phrase everything in active voice (.it showed. rather than .it tried to show. or .it was shown.). You should not use sentence fragments, nor turn verbs into nouns. Being precise means using words that are exact and specific, not vague. Economists value conciseness, which means saying things in as few words as possible. Happily, dropping extraneous words often improves the strength of your presentation.

Expect to revise and revise again to improve the quality of your writing. First make sure there are no grammatical errors or spelling mistakes (Use Spellcheck but also proof your paper). Then go through your draft and remove all unnecessary words. Once in a while a student tends to write in outline form; such students need to expand their explanation, they are too much inside their own heads, but not leading the reader through their arguments. Check that what you say in each sentence is clear and that paragraphs cover one topic and discuss it effectively. Make sure the argument develops from paragraph to paragraph.

Step 7: Oral Presentation

To make an effective oral presentation, especially in ten minutes, requires significant preparation and practice. You need to

- . Show why your problem is interesting and what gap you are addressing in the literature.
- . Summarize your model, stressing how it addresses the gap.
- . Describe how you tested your hypothesis with the model and the results you obtained.
- . Suggest what the results add to knowledge.

Make sure you know your project so well that you can answer questions on the material.

You will be expected to provide visual aids (usually Power Point slides) to complement your presentation. They can include an outline (your talking points), and your equations, data (perhaps a graph) and empirical results. Do not overcrowd slides with too much data or words (e.g. Do not just copy complex graphs from your paper) and do not make them distracting.

Once you have prepared the outline of your presentation, practice giving it several times. You need to see if you are clearly presenting the story of your research, as well as getting comfortable giving it to an audience. It is also very important that the presentation fit into time allotted. Pace yourself and don't be rushed. Remember, you are the person in the room (except perhaps your advisor) who knows more about this topic than anyone else. This is your opportunity to teach others what you have learned through the thesis process. On presentation

day, try to speak clearly and confidently, and fairly slowly. Be relaxed and remember that your slides are talking points, not something to be read. And of course, dress professionally.

V. SENIOR THESIS: WRITTEN ASSIGNMENTS

Organizational details of each assignment are discussed in this section. This section draws heavily on University of Akron, Department of Economics (2011).

A. Concept paper

The concept paper should be approximately 1 page long, may take the form of an email to your advisor, and consist of 3 parts:

1. Description of the research question. In this part you should address the nature of the economic problem. You need to briefly explain why the question is worthy of study. Spell out the hypothesis that you plan to test in the project and how it will advance our understanding of the problem (i.e. how it creates new knowledge).
2. Data description. In this part, indicate what data will be used in the analysis, and the sources you have found for that data. Be specific as to which time periods, states, or countries you have found for which you can get the variables you are exploring. This is most important for your dependent variable.
3. Initial bibliography. This should consist of the ten major papers written on the topic of your research question. At least one paper has to be no more than 2 years old. You may also include relevant news articles, if this is a timely topic, but these do not substitute for theoretical or empirical sources.

B. Thesis Proposal

The formal written proposal to be submitted to your advisor should be typed, double spaced, with headings for each of the following sections.

1. Research Question and Motivation for the Research.
2. Initial Literature Review. Show how what others have found either leads to your research question, or does not control for variables that theory or some other literature suggests be explored.
3. An explicit statement of what the paper will demonstrate including the major hypotheses to be examined.
4. An Initial Description of Data & Methodology: Indicate the general model you plan to use in your thesis, making clear why you are including each of the variables in the model. Provide

information on the available data you have found to use with the model. List fully the sources of the data, and provide a table of the descriptive statistics. Your proposal will probably be 6 to 25 pages, double-spaced, including the required table describing your data (means, standard deviations).

C. Senior Thesis Paper: drafts & final thesis

The first draft of your thesis should follow as much as possible the required format for your final version. Note that the technical guidelines for paper writing (written below), apply to both the draft and final paper. It is important to use them in your draft, so you can correct any errors before you hand in the final paper. That includes providing your list of references: do not leave that task to the very end!

The final paper should consist of:

1. A title page should be on a separate page with project name, author, date, thesis advisor, abstract, and any acknowledgements.
2. Abstract. The abstract is a one-paragraph summary of the hypotheses tested in the paper or ideas and applications developed, the theoretical framework and methodology developed to test them and the major findings of the paper. Journal articles used in your project can provide models of appropriate abstracts. It is the last item you complete for the thesis.
3. Table of Contents, include headings and sub-headings. Final draft should include page numbers.
4. Introduction to the Paper. This opening section should provide: (a) motivation for the paper, offer background and explain why the topic is important; (b) an exact and complete statement of purpose which usually will consist of a set of questions and a concrete hypothesis that the paper will test or answer; (c) a statement of the method the paper will use to test the hypothesis; and (d) an overview of the rest of the paper. You will find discussion of these items under the appropriate headings below. The final form of the introduction is the second last item you complete, just before the abstract.
5. Literature review.
6. Theoretical model development and specification. This ends with spelling out the specific equation you will empirically explore, and the expected signs on your explanatory variables.
7. Data. This identifies your data sources for each variable, any data cleaning you had to do (some states did not provide all the data you seek), what changes you have to make on the original data (e.g., construct rate of growth as a change in the log of the variable), the limitations on any proxies you have to use (what data did you seek, what were the issues with its availability, etc.). You might include graphs of your dependent and key causal variable(s). You must refer to your Appendix on data sources and means & standard deviations.

8. Econometric results and their interpretation.

9. Conclusion and Suggestions for future study

10. Bibliography. Make sure all the work you use in your thesis is listed in the Bibliography.

All articles, journals and books must be cited using the format in AEA (2012). There is no need to cite a website if you have the .pdf of an article from a database that was published in print. When citing websites, e.g., for a working paper, use the complete URL and please note the date that you accessed the site.

11. Appendix I. Data Sources, Means, Standard Deviations. When a website is used as a source of data, provide instructions to actually get to the data you are using. Readers need to be able to find the original data, so that they can replicate results. You may include all of your bibliography for your data in an Appendix table specifying your data sources.

12. Additional Appendices. Number and title each appendix. Some faculty request that you include copies of the relevant computer output in an appendix. Please note that tables derived from this computer output should be included in the section that presents your results. These tables should conform to the typing style used in the text of the chapter; do not consider an appendix to be a substitute for these tables.

The first draft needs to include items 1 and 3 to 7, that is up to and including your first quantitative results. Many of you will be thinking: now I'm done. Alas, that is not true. As everyone who has gone through the process will tell you, now you are beginning. The first results are likely not to be significant, or significant with the wrong signs. Now you have to work out what went wrong and how to change it and you need to start by consulting your faculty advisor.

Revising a draft can make a significant difference to your final grade. That is why four weeks are assigned to it. The document will need three or four drafts: continuous revision is an essential part of the research and research writing process. In the first draft you need to just get down the material: in later revisions you put together the convincing argument to readers of what you have found. You should expect to make major changes in both content and presentation, based on the feedback from your advisor and from your peers. All comments by your advisor on your draft should be read carefully and those comments should be taken into account when making changes. While you need not make every change recommended by your advisor, you should be ready to defend your decision not to accept the recommendations. You can expect your advisor to provide general and specific evaluative comments on the content of your draft but no detailed instructions for revising it: that is up to you. Look carefully for comments on omissions and do substantive work to deal with them.

If there are comments on grammar and clarity, then you must re-write. Remember that most writing goes through numerous re-workings for clarity and improved style. Your writing is supposed to reach professional standards.

Note that examination and return of a working draft does not imply that the paper is acceptable. The paper is never officially judged acceptable or unacceptable until it is in its final and complete form and has been read by both readers and the oral presentation has been made. Helpful comments at Ursinus can show you something to improve the thesis.

Make sure your final thesis meets all the style criteria and is a professionally presented piece of work, submitted by the required deadline.

D. Oral Presentations

After you submit your complete thesis draft, you will make two formal oral presentations of your topic to the Ursinus Conference, and then at the Celebration of Student Achievement to the economics faculty and your peers/friends. Each presentation should be about 15 minutes: 10 minutes for presentation and 5 minutes for questions. It is wise to discuss and show your .ppt slides to your advisor about a week before your presentation; successful slides used by other students will be available on SOCS. Rehearse your presentation ahead of time to learn to pace yourself, and to make sure your presentation is within the time limits. Plan to incorporate helpful comments from these discussions into thesis revisions.

E. Thesis Report for next year's seniors

Please write up a summary of your thesis process, how long it took to find your topic and how you finally narrowed it down, how long to write the first lit review (give them dates, it will help them), rewrite it in the spring, get the data, revise your model, run the regressions, get feedback, finish up. We're trying to help students take 494 more seriously and get them started earlier to help people finish on time. What could someone have told you that would have helped you nail down your topic sooner, or do other parts more easily? Feel free to talk about work responsibilities or access to campus computers or whatever else will give them a sense of reality about what it takes to do the thesis.

VI. PLAGIARISM

Plagiarism is presenting the words or ideas of someone else as your own without proper acknowledgment of the source.

If you don't credit the author, you are committing a type of theft called plagiarism. Plagiarism is a form of academic dishonesty (or, essentially, cheating).

When you work on a research paper you will probably find supporting material for your paper from works by others. It's okay to use the ideas of other people, but you do need to credit them correctly.

When you quote people - or even when you summarize or paraphrase information found in books, articles, websites, or other information sources - you must acknowledge the original author by providing a citation for the source. (DaCosta et al., 2008).

For more information, see University of Akron, Department of Economics (2011:3-4).

VII. EVALUATION OF THE THESIS

For Economics BA students, your ECO 495 economics thesis grade is a weighted average of the written thesis itself (70%), the Economics Fields Exam grade (15%), and the grade for your

presentation at Ursinus (15%).

For Economics BS students, your ECO 495 economics thesis grade is a weighted average of the written thesis itself (55%), the Economics Fields Exam grade (15%), the School of Business Exit Exam, and the grade for your presentation at Ursinus (15%).

Additional points will be lost by any student whose thesis work is not ready to present at either Ursinus or the Celebration of Student Achievement.

For an expanded view of what economics faculty look for, the basic framework used by the department is provided below in Appendix C.

VIII. DOING MORE WITH YOUR THESIS PROJECT

Speak with your thesis advisor if you want their help in coauthoring revisions of your thesis, or perhaps expanding it, for submission to a refereed journal. Alternatively you may pursue publication by yourself, see your thesis advisor to discuss strategies.

Appendix A

Variable Definitions, Summary Statistics and Data Sources: An Example

Variable	Definition [mean; standard deviation]	Source
<i>LCigSales</i>	Taxable cigarette sales per capita by state (packs). [4.34; 0.37]	Orzechowski and Walker (year)
<i>LCigPrice</i>	Retail price per 20-pack of cigarettes, by state, in 1982-84 dollars based on the Consumer Price Index (CPI) (cents/pack). [5.06; 0.28]	Orzechowski and Walker (year)
<i>Internet</i>	Percentage of state households with internet access. [0.43; 0.22]	Current Population Survey (CPS) and Goolsbee, et al (2010). CPS data available for 1993, 1997, 1998, 2000, 2002, 2003, 2007, 2009. Estimates for other years are interpolated from these data.
<i>LINCpc</i>	Per-capita state disposable income (deflated by the CPI). [9.56; 0.16]	Bureau of Economic Analysis
<i>LBorderP</i>	Minimum retail price in geographically contiguous border states (deflated by the CPI). [4.96; 0.26]	Author's calculations based on above data.
<i>RegShip</i>	State bans the delivery of cigarettes directly to consumer. [0.04; 0.20]	Chriqui, et al (2008)
<i>RegEvade</i>	State has law to deter tax evasion by internet vendors of cigarettes. [0.24; 0.43]	Chriqui, et al (2008)
<i>Mexico</i>	Dummy variable identifying states sharing border with Mexico. [0.08; 0.27]	
<i>Canada</i>	Dummy variable identifying states sharing border with Canada. [0.21; 0.41]	
<i>Producer</i>	Dummy variable identifying main tobacco producing states: Georgia, Kentucky, North Carolina, South Carolina, Tennessee, Virginia. [0.13; 0.33]	
<i>Casino</i>	Dummy variable identifying states housing one or more American Indian casinos. [0.81; 0.40]	Goolsbee, et al (2010)

Notes: The data include annual state level observations from 1994-2009. All monetary variables deflated by the Consumer Price Index (1982-84 = 100). Alaska and Hawaii excluded from the data set (no border states). Prefix L denotes a natural logarithm.

APPENDIX B

STYLE OF DRAFT AND FINAL THESIS PAPER

Both your *draft* and *final* thesis must meet the following guidelines.

1. Use only standard-size paper (8.5 x 11 inches). Use a 12-point Times New Roman font and maintain a 1-inch side, top, and bottom margin. Number all your pages, excluding the title page.

2. **DOUBLE-SPACE** the entire text.

3. **TITLE PAGE** should be on a separate page with thesis name, author, date, thesis advisor, abstract, and any acknowledgements.

4. **TABLE OF CONTENTS** is required and should note headings and sub-headings by page number.

6. **SECTION HEADINGS AND SUBHEADINGS** should be clearly detailed in your paper. These headings should have a physical layout that helps the reader comprehend the structure of the paper. Make the headings informative. Section headings should be centered and given Roman numerals (I, II, etc.); subsections should be lettered A., B., etc. and are left-oriented.

7. **ENDNOTES** must be double-spaced. The footnotes should be numbered consecutively (i.e., 1, 2, 3, etc.).

8. **REFERENCE TO INDIVIDUALS IN THE TEXT** should include the first name, middle initial, and last name in the first instance. Subsequent references should give last name only. Do not refer to individuals as Mister, Doctor, Professor, etc.

9. **REFERENCE TO ORGANIZATIONS OR GOVERNMENTAL AGENCIES IN THE TEXT** should give the name in full, followed by the abbreviation in parentheses -- subsequent references should give abbreviation only; for example: Social Science Research Council (SSRC) [first occurrence], SSRC [subsequently].

10. **REFERENCE TO ARTICLES AND BOOKS IN THE TEXT:** Give full name (first name, middle initial, and last name) of author(s) and year of publication in the first citation, with page number(s) where appropriate. Do not include the title of articles in the text, that is for your bibliography. When more than one work by the same author is cited, give the last name of author and year of publication in parentheses for each subsequent citation. When listing a string of references within the text, arrange first in **chronological** order, then alphabetically within years. If there are three or more authors, refer to the first author, followed by et al. and the year. If there is more than one publication referred to in the same year by the author(s), use the year and a, b, etc. (example: 1997a, b). References to authors in the text must exactly match those in the Reference section.

11. REFERENCE TO INFORMATION ON THE WEB: When citing Internet sources as a general rule include information on the (a) author(s) or publishing agency, (b) title of work, (c) print publication information, (d) title of online site, project, journal or database, underlined, (e) the date when the work was posted or updated electronically, (f) date when you accessed the site, and (g) electronic address (URL). For more information on citing Internet and other electronic sources refer to the MLA Web site at <http://www.mla.org>.

12. MATHEMATICAL EQUATIONS should be typed on separate lines and numbered consecutively at the left margin, using Arabic numbers in parentheses.

13. QUOTATIONS must correspond exactly with the original in wording, spelling, and punctuation. Page numbers must be given. Changes must be indicated: use brackets to identify insertions; use ellipsis dots (...) to show omissions. Also indicate where emphasis **has been added** (emphasis added). Only lengthy quotations (more than 4 lines) should be separated from the text; such quotations must be double-spaced and indented at the left margin.

14. TABLES must be on separate pages at the end of the thesis – not incorporated within the text – and should be numbered consecutively with Arabic numbers. In the text, after the paragraph where you first mention table 1, insert the following:

(table 1 goes about here)

Each table must have a title and should be no more than 10 columns wide. Use Panel A and Panel B to denote sections of a table. Do not abbreviate in column headings, etc. Spell out "percent"; do not use the percent sign. Place a zero in front of the decimal point in all decimal fractions (i.e., 0.357, not .357).

Table footnotes are also to be single-spaced. For footnotes pertaining to specific table entries, footnote keys should be lowercase letters (a, b, c, etc.); these footnotes should follow the more general table Note(s) or Source(s). Use asterisk (*) footnotes for the following: *Significantly different from 0 at the 1-percent level (or ** or *** or such other symbols as ⁺ or [^] for other significance levels). Full citations of the sources are to be included in the References.

15. Each GRAPH or FIGURE should full a page. Graphs are included after the body of the paper. They should be introduced in the text following the paragraph first referring to them by inserting the following between paragraphs:

(figure 1 goes about here)

Also label all axes, curves, and intersections in the graphs, number them consecutively, and provide full footnotes on the graph page wherever relevant. All graphs should have a clear number, title and source attribution.

16. REFERENCE SECTION must be double-spaced, beginning on a new page following the text, giving full information. Use full names of authors or editors (last names first), using initials only if that is the usage of the particular author/editor. List all author/editors up

to/including 10 names. Authors of articles and books and material without specific authors or editors, such as government documents, bulletins, or newspapers, are to be listed alphabetically by publishing agency.

A) **Books**: List Author or Editor. Title. Place of publication: Publisher, year.

B) **Articles**: List Author. "Title of Article." Journal, month and year of issue, volume (and issue number) in Arabic numerals, inclusive of page numbers. Specify if volume is part of title (volume 2) or not (Vol. 2).

C) **Unpublished Papers**: List Author. "Title." Working paper or discussion paper (including number if any), institutional affiliation, date.

D) **Chapters in Edited Volumes**: List Author. "Title," Editor, Volume Title. Place of publication: Publisher, year, inclusive page numbers. Specify if volume is part of title (volume 2) or not (Vol. 2).

17. DATA SOURCES must be given with full information and listed in the References or in a separate Data Appendix.

18. OTHER STYLE POINTS: (1) In the acknowledgement footnote on the title page, feel free to acknowledge your thesis advisor and anyone else you feel has helped you with your paper. (2) Do not use the % sign in the text; always spell out the word percent; (3) Apostrophes are used for decades (i.e., 1990's), not generally for plurals (i.e., HMOs); (4) Hyphenate compound adjectives when they come before a noun, not after (i.e., a well-known author; an author well known).

19. LENGTH of the paper may be approximately 15-45 pages.

APPENDIX C

SENIOR THESIS RUBRIC

C.1 TCNJ Economics Faculty Thesis Advisors. Senior Thesis Assessment - Written and Oral Communication

Written Communication

Objectives	Low performance (1 pt)	Acceptable (2 pts)	Exemplary (3 pts)
Research Question	No research question	Clear statement of the research question and some discussion of the relevance of the question.	Clear statement of the research question and discussion that builds a strong case for the relevance of the research question.
2. Literature Review	Literature review missing or not relevant to the research question.	Coherent literature review relevant to the research question but some small problems (i.e., not comprehensive or current).	Coherent literature review relevant to the research question that is comprehensive and current.
3. Support for Conclusions	Unsupported or no conclusions.	Conclusion that highlights key results.	Conclusion that highlights key results and makes key points for the broader significance of the results.
Earned Points			

Oral Communication

Objectives	Low performance (1 pt)	Acceptable (2 pts)	Exemplary (3 pts)
1. Voice Quality and Pace	Demonstrates one or more of the following: mumbling, hard-	Can easily understand - appropriate pace and volume. Delivery is mostly clear and	Excellent delivery. Conversational, modulates voice. Projects enthusiasm,

	to-understand English, too slow, too fast, verbal filler.	natural.	interest, and confidence.
2. Use of Media/ Rapport with Audience	Relies heavily on slides or notes. Makes little eye contact. Inappropriate number of slides.	Maintains eye contact with audience 90% of the time. Appropriate number of slides. Looks at slides to stay on track.	Perfect eye contact. Slides used effortlessly to enhance speech.
3. Ability to Answer Questions	Cannot address basic questions.	Can address most questions with correct information.	Answers all questions with relevant, correct information. Speaks confidently.
Earned Points			

Total

C.2 TCNJ Outside Reader's Scores (1 to 3 scale) on Senior Thesis Assessment

(3 = exceeds expectations, 2 = meets expectations, 1 = falls short)

Written Communication

1. Definition of research question
2. Quality of literature review
3. Support for conclusions

Statistics

1. Variable definitions and relevance
2. Appropriate analysis and statistical diagnosis
3. Explanation of results
4. Support for conclusions

Oral communication

1. Voice quality and pace
2. Use of Media/rapport with audience
3. Ability to answer questions

C.3. ECONOMICS DEPARTMENT, UNIVERSITY OF AKRON, OHIO

Step 1. Developing an effective research question

Evaluation Questions:

- . Does it clearly articulate a problem & the research question?
- . Does it articulate the problem in terms of why and how rather than purely descriptively?
- . Is it interesting & significant to economics?
- . Is it innovative? Does it add to our understanding of the economic issue?
- . Is it amenable to economic analysis?
- . Is it feasible and can it be completed in the prescribed time frame?

Step 2. Surveying the literature on the topic

Evaluation Questions:

- . Does it give a narrative to the research, showing how to understand the problem?
- . Does it review what is currently known on the topic?
- . Does it include the major studies?
- . Does it include irrelevant studies?
- . Does it identify major findings to the present?
- . Does it discuss and evaluate authors' arguments?
- . Does it point out major deficiencies or gaps the research plans to address?
- . Does it explain clearly how the research will contribute to the literature?
- . Does the reader understand that the writer understands?

Step 3. Analyzing the issue or problem

Evaluation Questions:

- . Does it effectively apply economic theory to issue or problem?
- . Is the model used theoretically relevant to the research question?
- . Does it use economic language?
- . Does it clearly describe the theory relevant to the research?
- . Does it include all the necessary complexity of the application of economic theory in the research?
- . Does it present a logically deductive argument for the research hypothesis?
- . Does it state the assumptions needed?
- . Is the research hypothesis formulated so that the results can have meaning: i.e. is the hypothesis something that can be tested?

Step 4. Testing your analysis

Evaluation Questions: Data

- . Is data set large, rich and accurate enough to adequately test hypothesis.?
- . Is sample size large enough with appropriate statistical properties?
- . Is nature of data adequately explained?
- . Has data been appropriately cleaned and prepared?
- . Is data relevant to the problem?
- . Does data set have enough variation in the relevant variables to test the hypothesis?
- . Is there a clear chart of the descriptive statistics of the variables?
- . Is data manipulation and variable creation done within SAS?

Evaluation Questions: Empirical Testing/Analysis

- . Does the econometric model reflect the economic model and the econometric variables relate to the economic variables?
- . Can the statistical methods used adequately test hypothesis & discriminate from alternative hypotheses?
- . Is the relevant estimation technique used to address the problem? If not are the limitations of the method used explained?
- . Is the empirical model stated clearly, with each variable defined, and its units of measurement and expected signs included?
- . Do statistical analyses presented include all appropriate results and statistical tests?
- . Are the results robust to slight changes in model specification?
- . Are results presented in clear, understandable professional-looking tables?

Step 5. Interpreting the results and drawing conclusions

Evaluation Questions:

- . Are limitations of data set clearly explained?
- . Is it made clear what results mean?
- . Are the coefficients clearly interpreted, including their statistical properties?
- . Is goodness of fit evaluated?
- . Is there an understanding of the difference between economic significance and statistical significance?
- . Are appropriate conclusions made of results of the research?
- . Are policy conclusions suggested and/or additions to knowledge made clear and justified?
- . Are unusual results addressed and explained?
- . Are shortcomings and limitations of research stated?
- . Are future improvements suggested (that might be feasible)?
- . Does paper identify effective future research?

Step 6. Communicating in writing the findings of the research project

Evaluation Questions: Written Document

- . Does it have all the elements included (title, abstract--- to references & citations)?
- . Is the reference list complete and does it use correct citation style?
- . Is data appendix complete, correct and adequately described?
- . Does the research paper communicate a convincing argument supported by logic and effectively communicated empirical evidence?
- . Is writing organized in logical hierarchical manner?
- . Are there weak or missing links?
- . Is the thesis clear?
- . Does the paragraph order make sense?
- . Is it easy for the reader to comprehend your writing without having to work at it?
- . Is the argument/explanation completed in the least possible words?
- . Does it include sections that are unclear because you do not understand what you are writing about?
- . Is the writing clear: having a subject and verb as central?
- . Is writing focused: e.g. using thesis sentences for each paragraph with remainder of sentences supporting?
- . Is the writing close to plagiarism?
- . Are paragraphs a single idea?
- . Do the sentences make sense?
- . Does it use strong verbs?
- . Does it avoid using nouns that should be verbs (e.g. There was a failure instead of it fails)
- . Does it use unnecessary long words that make it difficult to understand?
- . Is most if not all of the writing in the active voice?
- . Is the grammar correct?
- . Is the writing concise? Have you chosen words that mean exactly what you want to say?

Step 7: Communicating orally the results of the research project

Evaluation Questions:

- . Is the content for the presentation well organized?
- . Has the presentation been practiced in advance?
- . Is your voice clear and confident?
- . Are aids (Power Point etc.) of high quality?
- . Are aids high quality and relevant?
- . Can presenter answer questions on project effectively?
- . Does the presentation fit into the time frame required?
- . Does the presenter have a professional demeanor?

Appendix D

FREQUENTLY USED STATA & SAS COMMANDS & PROCEDURES

FREQUENTLY USED STATA & SAS COMMANDS & PROCEDURES

.PWCorr y x z gives pairwise correlations for the 3 variables y, x and z.

.Regress y x z regresses variable y on variables x and z

.Stepwise, pe(.20): regress y x z

Runs a stepwise regression for y on variables x and z, adding in variables significant at least at the 20% level

Time-series Data:

.Tsset year To set your time-series variablename (assuming you called your years “year”)

Then after any regression you want to check for autocorrelation, immediately type

.Estat dwatson

And it will give you Durbin-Watson stats. You’ll have to look up the relevant range for DW significance, given your # regressors and sample size.

To run an equation corrected for Durbin-Watson issues, type

.Prais y x z To regress y on variables x and z, correcting for autocorrelation

Heteroskedasticity

Immediately after you’ve run a regression, type

.Estat hettest

This will let you know the probability of no heteroskedasticity – if your probability is very low, you need to estimate robust coefficients. Type

.Regress y x z, robust

Adding the **robust** command in a regression corrects for heteroskedasticity.

Time-series Data and Stationarity

.Dfuller x

- gives Dickey-Fuller stat for variable x. Checks for stationarity of trend variables.
Notice, more strongly negative MacKinnon statistics mean stationarity is less likely.

If your variables are non-stationary, you'll have to calculate "changes in" for all your variables, and run Dickey-Fuller tests on these "change in" variables.

Special Dependent Variables: Proportions; Dummy Variables

Proportions as Dependent Variable

Natural Logs

If your dependent variable is a proportion, whether 0 to 1 or 1% to 100%, then it is truncated - it can't be more than 1 (100%) or less than 0 (1%). So for consistent estimation, you need to log your dependent variable, which will spread out the range of the variation. If any of your regressors (explanatory variables) are also proportions, log them as well so they are being handled in a symmetric fashion. You can then run OLS regressions on this logged data.

Logit Transformation

If you take the log of (your proportion/(1-your proportion)), this transformed variable has the merit of looking much more like a straight line than a simple proportion could – the latter is subject to a binomial distribution. So many researchers use a logit transformation on proportions, on both dependent and explanatory variables which are proportions.

What to do if any of your proportions actually equal 0

The solutions based on logs or logit transformation will not work if any of your answers are actually 0, because the log of zero is undefined. Then you will have to use a generalized linear model or GLM estimation to prevent biased coefficient-estimates on your raw data. This is a form of maximum-likelihood estimation:

.GLM y x z

Gives you maximum-likelihood estimates for the effects on y of x and z.

Dummy Variable as Dependent Variable

If your dependent variable is either 0 or 1 (e.g., you are or are not a juvenile diabetic), you have to perform a **probit** regression:

.Probit y x z

Will calculate regression coefficients for your kind of dependent variable.

Panel Data

First, make sure you have told Stata what your cross-section & time-series variable names are, e.g., but typing

.Tsset StateID Year [or **.Xtset** StateID Year]

Or

.Tsset CountryID Year [or **.Xtset** CountryID Year]

You need to include a StateID variable which translates state names or abbreviations into a numerical equivalent; for instance,

<http://www.epa.gov/enviro/html/codes/state.html>

provides the FIPS codes for each state, which is a number.

If you have panel data, you want to control for fixed effects. Suppose you have state data. There will be cross-section idiosyncracies, such as some states always tending to have higher or lower values of your dependent variable than others because of unspecified state-characteristic variables. Then run

```
.Xtreg y x z, i(StateID) fe
```

This runs a regression while allowing you to control for fixed effects (via fe command).

Testing panel data for heteroskedasticity

```
. xtgls ... , igls panels(heteroskedastic)  
. estimates store hetero
```

fits the model with panel-level heteroskedasticity and saves the likelihood.

We can fit the model without heteroskedasticity by typing

```
. xtgls ...
```

Now there is one trick. Normally, **lrtest** infers the number of constraints when we fit nested models by looking at the number of parameters estimated. For **xtgls**, however, the panel-level variances are estimated as nuisance parameters and their count is NOT included in the parameters estimated. So, we will need to tell **lrtest** how many constraints we have implied. The number of panels/groups is stored in **e(N_g)** and, in the second model, we are constraining all of these to be single value, so our number of constraints can be computed and stored in a local macro by typing

```
. local df = e(N_g) - 1
```

The test is then obtained by typing

```
. lrtest hetero . , df(`df')
```

Testing panel data for autocorrelation

There is a user-written program, called **xtserial**, written by David Drukker to perform this test in Stata. To install this user-written program, type

```
. findit xtserial  
. net sj 3-2 st0039  
. net install st0039
```

To use **xtserial**, you simply specify the dependent and independent variables:

. xtserial *depvar indepvars*

A significant test statistic indicates the presence of serial correlation.

Correcting panel data for autocorrelation, controlling for fixed effects:

. xtregar *depvar indepvar1 indepvar2*, fe

Correcting panel data for both heteroskedasticity and autocorrelation

. xtgls *depvar indepvar1 indepvar2* , panels(hetero) corr(ar1)

Resources:

Stata's "Help" feature is very useful. Click "Help" then "Search." Type in your topic. Choose among the options whichever sounds closest to your topic. At the end of each explanation, Stata typically provides Examples – these are very useful templates for modeling your adoption of that technique.

Princeton University has great Stata web-based help information. Go to

http://dss.princeton.edu/online_help/stats_packages/stata/

and search on your topic. Or a Google search on "Stata Princeton your topic" will usually take you there.

TYPICAL SAS COMMANDS:

General Regression: with White test

```
data copper;  
input YEAR PRICE Q;  
datalines;  
~data~  
;
```

White Test:

```
data mileage;  
input HP MPG MPGF VOL WT SP one;  
datalines;  
;  
proc reg;  
model mpg = hp VOL WT SP/r p;  
output out=out1 r=r1 p=y1;  
run;  
data out1;  
set out1;  
r1sq=r1**2;  
ysq=y1*y1;  
lr1sq=log(r1sq);
```

```
proc reg;
model r1sq=y1 ysq;
run;
```

Testing Restriction Statements:

```
data product;
input YEAR Y X1 X2;
$ define Y = Real Gross Product, Millions of NT
X1 = Labor Days, Millions of Days
X2 = Real Capital Input, Millions of NT $
datalines;
;
proc reg;
model y=x1 x2/r ;
test x1+x2=1;
output out=out1 r=resid p=yhat;
run;
data test;
set out1;
ly=log(y);
lx1=log(x1);
lx2=log(x2);
proc reg;
```

```
model ly=lx1 lx2/r;
test lx1+lx2=1;

run;

proc reg;
model ly=lx1 lx2;
restrict lx1+lx2=1;

run;

proc reg;
model ly=lx1 lx2 / noint;

run;

proc reg;
model ly=lx1 lx2;
restrict intercept=0;

run;

proc reg;
model ly=lx1 lx2;
test intercept=0;

run;
```

WLS For an unknown functional form (From Class):

Data;

Infile 'a:\SAVING.raw';

```

Input sav inc size educ age black cons;

cards;

;

Thesis Advice from Economics Seniors, Fall 2011-Spring 2012

Jaffer Ahmed

Thesis Advice

Preparing and writing the thesis is a long and time-consuming process that requires time management in order to complete it on time. Working on the thesis along with the regular course load is tough so starting to prepare over the summer before taking ECO494 will help greatly in putting you ahead of the schedule. Picking out a topic over the summer will save a lot of time during the semester. After picking a topic, you must make sure its concise enough to write a thesis on. You have to also make sure that there is data for your topic that is available for access. You have to also make sure there is enough data, which can vary depending on your topic. If you can pick out a topic and find a reasonable dataset to start off with during the summer before the fall semester starts, it will make life much easier as you wouldn't have to spend so much time during the semester searching for a good topic that interests you.

For my thesis, finding the topic and data source was relatively easy. However my dataset was not given in a complete set, ready for analysis. The data needed to be taken for 150 observations separately, and combined into one dataset. Finding, combining, and cleaning up the data took the longest time for me. Since this was also during a very busy semester, it took me over half the semester just to organize and clean up the data. One thing you should do is make sure you know how to manage your time well with the semester so you can also spend time working on your thesis. The toughest part is to make sure your dataset is large enough and has no problems. The toughest part of the whole thesis process in my case was

not writing the paper itself, but working on the dataset for it. Therefore, one should put aside enough time, and prepare to do a lot of time-consuming work in preparing the data. If your data is good, then analyzing it and writing your paper will be easy.

Mark Azic
Thesis Review

The first semester of senior year, when we are supposed to be writing a thesis proposal, should be better defined. I didn't even know that there was a thesis prep course until it had already started. Also, it was confusing as to whether or not the thesis prep course was mandatory or not. The few weeks I went to the prep course, it would include only a fraction of the senior economics majors, and some faculty members wouldn't even show up. By the time the last prep course meeting was finished, I didn't have a topic, and I feel like many other students were in a similar position. The prep course should be better defined so as to require students to develop a topic.

I didn't get a topic until a couple of weeks into the second semester. After picking my topic, I had to learn the econometric techniques I was going to use for it (vector autogression) which took some time. Next, finding data was extremely difficult. The data I did end up using was taken from a variety of sources and did not so much include countries that I was especially interested in seeing the relationship between as it included countries that I could find relevant data for.

Also, I really wish that I picked a topic and began researching it in the first semester because the topic I chose was pretty ambitious. Doing justice to the topic requires a lot of work, and choosing to write it entirely in one semester was very difficult. By the end of the semester I was tired of working on the paper, and unable to complete everything that I would have liked, such as including dummy variables for different time periods and testing for structural breaks. Had I chosen my topic and found research on it within the first semester I would have had time to learn about what vector autoregression was and how to use it, begin finding data, and reviewing other relevant literature on the topic. This would have made it much easier to write my paper in the second semester and to have completed everything that I would have

liked to on it.

In conclusion, I wish that as a junior I knew how much work it would be to write a thesis, and had started

to at least think about ideas for a thesis then. Other than the time constraint, I enjoyed writing the thesis.

Being able to choose a specific topic in economics that I'm interested in was a much better experience

than most other classes economics classes (not that they're bad!), and my only regret is not starting

earlier.

Nick Falcone

Thesis Report

Timeline and Details

Topic and Literature Review

My ultimate topic was inspired by an HBO documentary I watched the summer before senior year. I ended up having two ideas, but choosing one by the middle-end of the fall semester. I started the literature review around then and finished it two days after the semester ended. I would advise against that.

Data

I began looking for data toward the first or second week of the spring semester. I got lucky and did not have much trouble finding what I needed but I had enough time to accommodate a longer, more tedious search (which I hear is more typical). I had a complete dataset at some point in late February or early March and started running regressions about one week later. I did a logit transformation of my dependent variable because it was a proportion. Transformations, to me, are not as intimidating as they seem – just some time and a few maneuvers in Excel. Be able to explain why you used the transformation you used (if one was necessary).

I had some results to present at Ursinus. Make sure you do as well, because presenting a paper without at least initial results is sort of embarrassing. It's also helpful in terms of time. The two weeks after the conference will be very hectic if they contain all of your data analysis. My presentation at the Celebration

of Student achievement contained my final results. I still needed to interpret them in the paper afterward, but the Stata work was complete.

Final Thoughts

.Start early. is a big cliché, but it's true. Give yourself the time to do things the right way. In terms of how to do things the right way, I would suggest thinking deeply about what you want your model to say. Think about the relationship you're testing and what measures, structure, controls, etc. make the most sense. Make it as complete as possible (within reason) and try different things. If I could have done one thing differently it would have been to use more controls and not use two of the variables that ended up in my final model.

The thesis is a big undertaking but also a great opportunity to make a contribution and communicate your point of view. If you think of it more in these terms and less as an obligation, everything should fall into place.

Scott Francis Thesis Process Summary

I started the Thesis process in the fall of 2011 with my Thesis Preparation Class. After attending the first couple of classes I had an idea of what I wanted the subject of my thesis to be. I started to skip the Thesis Prep classes, because I thought I was done my thesis prep since I had decided on a topic. I put my thesis on the back burner and concentrated on my other classes and work thinking I could just write my prospectus really quickly before the end of the semester. This was a big mistake! I put it off until the end of the semester and then realized that finding sources that apply to my topic wasn't very easy. I was then dealing with finals, work, and trying to scramble and find sources for my literary review. This lead to me throwing together a bad literary review with some sources that weren't very strong, and I had to rewrite my prospectus to better reflect my topic and data. The semester was over so I had to spend my Christmas break doing all of the work I should have been doing during the fall semester. This is not something I recommend doing and it just weighed down all me all break thinking about how I was behind and not finished. "What if I don't graduate?" is constantly running through your head and it's not a fun thing to think about.

I then started my Thesis class in the spring of 2012 after working all break to catch up with my classmates. I decided to get proactive this time and looked up a bunch of data that I thought would work for my topic. Thinking I was ahead of the game and that I only had to run some easy regressions now I put my thesis on the back burner and concentrated on my classes and was needed at work more. The end of the semester came around and I was just getting started running my regressions. I really looked hard at my data and realized that my data didn't match up. I was in a horrible situation. I ended up having to find all new data and I was supposed to be done my thesis already. Everyone is talking about their jobs and

what they are going to do after graduation, and I was thinking I still don't have all my data for my thesis. I may not graduate on time.

I ended up not graduating in the spring of 2012. I didn't finish my thesis on time and had to finish it over the summer. This prevented me from really looking for jobs and starting my life after college because I had this huge thing hanging over my head. I ended up doing the work that I should have done in the spring while I was supposed to be graduating having a good time. I eventually finished my thesis by the end of the summer, and now I can pursue my career 3 months after expected. Finally finishing and graduating is the greatest feeling ever. You want to do it on time and you want to do it worry free. I wish I could go back and just get all of the work done in the fall of 2011 because if I would have had everything planned out and ready for my thesis class, then it really wouldn't have been that hard or stressful. I made it much harder on myself than it had to be all because I thought I could get it done in a couple of weeks. **THIS IS NOT THE CASE!** You are going to run into problems and you are going to have to change things during the process of writing your thesis. It is time consuming and should be taken very seriously. I did not and paid the price.

Katelyn Klinck

Thesis Report

Personal Timeline:

I began work on my senior thesis knowing that I wanted to pick a topic relevant to today's current economic issues. I also had found my health and labor economics courses very interesting and knew that I would like to do something regarding those topics. I narrowed my possible topics down to three choices and researched literature on those topics. I found an overwhelming amount of information on the current economic crisis, the baby-boomer generation, and their impact on retirement over time. I was able to narrow in on this topic around the end of September.

I worked on my literature review, mainly gathering research, throughout the first semester. I was able to submit a written copy of my prospectus before winter break. During winter break I edited my prospectus based on Professor Naples comments and began to gather data. The data gathering took much longer than expected. I kept thinking of new variables that would benefit the model and then would at times find collinearity between the variables and would have to decide which to keep in the model. I started running correlations and graphing the data around the end of February in order to interpret the data I was gathering.

By the beginning of March I began to run my regressions, which led to more data gathering in order to correct for problems I saw when running the regressions. Based on the new data, and new findings, I had to re-run various regressions with different data. I also had to log the data and take the first difference in

order to correct for heteroskedasticity and stationarity issues. I spent a total of 3 weeks running the regressions before I began to write the paper. It took 3 weeks because I had to re-learn some parts of econometrics and learn about stepwise regressions and STATA for the first time.

I began to write my paper around mid-March, finishing around the second week of April. Writing the paper pushed me to think more about the data and I realized problems I was having and what other data I would have to find and other tests I would have to run to fix these problems. Because of the problems I realized while writing the paper I only had some significant results to discuss at Ursinus, but I also had an idea of what was necessary to achieve my desired results. I was able to present these new findings at the celebration of student achievements at the end of April. After the celebration of student achievements presentation I had minimal writing and regressions to run. The few things I added to my paper were mainly based on suggestions from my presentation.

Knowing what I know now, I would attempt to do more of the writing for my prospectus (I focused a lot on researching and saved the writing for the last month) and gathering actual data (with correlations and graphs) in the first semester. My data gathering took the longest and left me less time to write the actual paper since it trickled into the second semester. I recommend that anyone working on their thesis should try to have a fully edited literature review and data with graphs and correlation matrixes by the end of the first semester so that you can focus on running regressions and writing the rest of the paper during the second semester.

Chris Matta

Thesis Report

These are some of my thoughts on the senior thesis:

Attend all weekly meetings to stay on top of your work.

Start early and get ahead while you have more free time.

Be flexible with your topic based on available data.

Use reference librarian Terrence Bennett to help you.

Search for books in addition to online references. Many books have useful information that is not

on the internet.

Jordan Mojka

Thesis Overview

Unlike the majority of the other senior thesis students, I began my thesis at the very end of my junior year. While I would suggest beginning the thesis as early as possible, I needed to begin and complete my literature review (the portion of the thesis that is normally completed in Fall semester of the senior year) so I could write my thesis during the first semester of my senior year

in order to be considered a full time student during my J&J co-op. As a result, my experience was very different than other students in that my experience was very independent and separated from the remainder of the seniors.

When I began the thesis my junior year, I originally wanted to focus on Economics of Law. However, after spending the next month and a half trying to find research on the topic that was experimental proved to be fruitless, I decided to change my topic to a project I worked on during

a finance co-op I had in the beginning of that summer. During that project, I was asked to analyze the impact of different macroeconomic variables on the company's revenue. I found the topic extremely interesting and wanted to see if I could determine a revenue-forecasting model for a particular company. Thus, in the beginning of August I began to researching the topic. However, it was also extremely difficult to find research for my new topic. After a month of research, I found that no study had been done that created a revenue-forecasting model for a specific firm with macroeconomic variables. Instead, I needed to focus on studies that used macroeconomic variable to forecast macroeconomic events and focused on consumer consumption habits. I was able to finish my initial literature review by the very beginning of September.

Once my literature was finalized with Dr. Naples (approximately middle to end of September), I

began looking for my data. I mainly use the Bloomberg terminal for my data in order to find Walmart's quarterly revenue and the multiple macroeconomic variables. However, finding my data was slightly difficult in Bloomberg simply because I had never used the terminal before. I was able to begin running a correlation matrix and regressions by the end of October. My regressions were relatively simple in that I only needed to correct for autocorrelation, which required me to use the .prais. command in Stata instead of regression command.

Since I wrote my thesis in the Fall semester, I had my entire thesis to present at both Ursinus and

the Celebration of Student Achievement. While it was nice to be done with my thesis at that point and able to present the completed project, it would have also been nice to go back with the suggestions from both audiences and improved my thesis.

If I was able to re-do my thesis, I would have made myself more disciplined last summer when I was finding research for my literature review. It was extremely difficult managing two different internships/co-op's and working on the thesis after work, however, I believe that I could have completed the literature review earlier, and thus would have made more time to find data and run regressions, and thus determine a more complete model.

Overall, I would suggest that anyone working on his or her senior thesis should begin as quickly as possible simply because more time will enable them to look into additional findings that are presented by the final models.

AnnMarie Pino

Thesis Report

The topic I chose was on the non-genetic factors that influences the onset of type 1 diabetes. I did not take me long to come up with topic and I had this idea about one month into the fall semester. The literature review took approximately the rest of semester to research and write. Personally, I created a survey in order to collect data and this took about two months to construct and gain IRB approval. My survey was approved on February 16 after being submitted on February 13 in which I was given an expedited review. After spring break I had all of my data.

I began running regressions and writing about my theory and methods shortly after this. Regressions always take longer than you think so I would have liked more time to do this. Since

my dependent variable was binary I ran a probit regression. Other tests to keep in mind: stepwise, heteroskedasticity, and correlation matrix. Although the time crunch was close, I had good data and results to present at the Ursinus conference. Afterwards I did run some additional tests before the second presentation at Student Achievement day. After this time I had a lot of editing and writing still left to do.

Some advice would be to think of your topic early and to have your literature review finished before Thanksgiving. Because of this, you can start collecting your data over winter break and then start running regressions at the beginning of the spring semester. Most importantly, utilize your professors. Talk to your past economic professors whose class you found interesting. All of them are more than happy to help and you never know what will trigger a topic idea. Be open to suggestions because once you are immersed in a large project such as this, it can be easy to miss things. Most importantly, choose something you are truly interested in because you are working on this for a year.

Robert Poss

Thesis Report

In the Spring Semester of 2012 at The College of New Jersey I researched and wrote a thesis on violence and scoring in the National Hockey League. I read numerous articles concerning violence's place in the game and also its effect on ticket sales. I researched a number of variables, most notable points (wins), goals (scoring), and penalties (violence) and compare them

to the attendance rate of each of the 30 teams for the last 10 seasons. The results were quite surprising. All in all I learned a great deal from the whole process and enjoyed all the challenges

associated with writing an economic paper.

I feel I have become more fluent in several statistical frameworks although I doubt I will pursue these in my future endeavors. I have a new-found appreciation for all of the time and hard work associated with the research and statistical estimation associated with econometrics and economic principles in general. I now know that there millions and millions of questions out there in the real world and with the tools I have learned I may be able to solve just a few of these

questions. I hope that everything I learned during the course of writing my thesis will prove beneficial to myself later in life.

Jimmy Shaw

Thesis Report:

-Senior Thesis Prep: November and early December was when I spent most of my time research on my topic. I looked for articles and data. Since I was working with 3rd world countries, it was a nightmare trying to find economic data earlier than the late 1990s (Asian financial crisis). The World Bank had data 1.5 years behind the current date which drove me insane when talking about the most recent recession (2008).

-Senior Thesis (spring): My experience with writing and planning a thesis was terrible. There was little education on tips and tricks for writing a thesis. I was lucky in taking econometrics as a junior, but for these students taking it as a senior, they must of had a huge learning curve. I ran a typical regression and used vif and hettest commands.

-Presenting: I feel presenting at Ursinus and at Student Achievement should be optional. If the student wanted to share his/her work, they should have the option to. Also, if they are running behind in research and writing, this automatically causes the econ department frown upon those students. It should not be counted as a grade and honestly, we are seniors in college, we know how to field questions, we don't have time between finishing up other projects and finding jobs to be wasting our time talking to others in academia (no offense).

Overall: I understand the thesis is independent, but there needs to be some structure. I felt overwhelmed, did not feel valued as a student, and had anxiety because I was outside of my comfort zone with no one to be there for me.

I was given an incomplete and my final version was submitted the first week in June (grade still pending).

I hope this helps.

Alysson Wong

Thesis Report

Choosing a Topic

I began thinking about my thesis topic as soon as the fall semester began. I wasn't too sure what my topic was (obesity) until I began doing another project in my Global Public Health class which wasn't until mid-November. I then proceeded to do the basic Prospectus (Intro, Literature Review, and data sources) which I handed in, in early December. Looking through the literature I discovered the usual factors people associate with obesity (fast food consumption, not exercising, socioeconomic status, etc), and chose to see which the major contributor was by looking at several countries. Upon reading the prospectus, however, Dr. Naples advised me to expand my research and further my thesis since it may not be as challenging a feat as I anticipated. After exploring some more, I finally decided to include antibiotic consumption, the use of antibiotics on livestock, as well as confectionary consumption. I handed my complete Prospectus early January.

Data Collection and Running Regressions

Beginning the first week of the semester, I met with Dr. Naples once a week to discuss my data collection and the progress I was making. The data collection proved to be quite difficult, and much more time consuming than I had originally planned, especially for the more underdeveloped countries. The variables that proved to be the most difficult were pharmaceutical expenditures, motor vehicle consumption, and fast food prevalence. Eventually I was able to find the pharma data, excluding a few years, as well as one

year's worth of car consumption which I chose to use as a fixed effect. For the fast food, however, I had decided to find the number of local and foreign fast food restaurants that existed in each country. Many of the local fast food restaurants did not provide their financial statements, so I was unable to measure the fast food consumption through the businesses' performance. Since there was not an exact list I had to go to each restaurant's website and count them individually using the restaurant locators. By the last week of March, I was only halfway through the number of U.S. restaurants and had to abandon the variable altogether.

Since the Ursinus Conference was fast approaching, I only had a little over two weeks to start running regressions, writing my thesis, and preparing for the conference. I ran into many complications with my results due to high correlations among the data, heteroskedasticity, autocorrelation, etc. Also, because I had panel data and due to the statistical software I was using, STATA, I had to manipulate the format of my input data that took up a lot of time; apparently the program does not like repeated years which I had due to my panel data. Due to these obstacles I had to transform the data several times (separate the data run regressions on individual effects, log the data, and take the difference in), and was not completely finished for the Ursinus Conference; though I was able to present my current results and future plans for the thesis.

After Ursinus Conference

The students and faculty that observed my presentation at the conference were extremely helpful, and provided valuable feedback on how to analyze my results. I did several more regressions following the conference and by Student Achievement day, I had completed the written part of my thesis.

What I would have done differently

While I was able to complete everything in a timely fashion, there are a lot of things I would have done differently that would have saved me a lot of time and energy. For one, I wish I could have come up with

a finalized topic during the fall semester and began the data collection before Winter Break. Also, if I could have met with Dr. Naples a few times during the fall semester it would have sped up the whole process since she was an extremely valuable resource. If I had been able to do this, then I may have been able to focus solely on running regressions during the spring semester. This would have allowed me to present a lot more results, if not my complete thesis at the conference. Also, I should have done a bit more research on STATA commands before I started running regressions. That would have been much easier than searching for commands as I was working; I found looking them up quite time consuming. Overall, I just wish I had been more conscious of my time management since the spring semester comes to a close faster than one would think.

Thesis Advice from Economics Seniors

Economics Thesis Student Reports & Advice, Fall 2011-Spring 2012

Jaffer Ahmed

Thesis Advice

Preparing and writing the thesis is a long and time-consuming process that requires time management in order to complete it on time. Working on the thesis along with the regular course load is tough so starting to prepare over the summer before taking ECO494 will help greatly in putting you ahead of the schedule. Picking out a topic over the summer will save a lot of time during the semester. After picking a topic, you must make sure its concise enough to write a thesis on. You have to also make sure that there is data for your topic that is available for access. You have to also make sure there is enough data, which can vary depending on your topic. If you can pick out a topic and find a reasonable dataset to start off with during the summer before the fall semester starts, it will make life much easier as you wouldn't have to spend so much time during the semester searching for a good topic that interests you.

For my thesis, finding the topic and data source was relatively easy. However my dataset was not given in a complete set, ready for analysis. The data needed to be taken for 150 observations separately, and combined into one dataset. Finding, combining, and cleaning up the data took the longest time for me. Since this was also during a very busy semester, it took me over half the semester just to organize and clean up the data. One thing you should do is make sure you know how to manage your time well with the semester so you can also spend time working on your thesis. The toughest part is to make sure your dataset is large enough and has no problems. The toughest part of the whole thesis process in my case was not writing the paper itself, but working on the dataset for it. Therefore, one should put aside enough time, and prepare to do a lot of time-consuming work in preparing the data. If your data is good, then analyzing it and writing your paper will be easy.

I didn't start with any one topic; I had a list of about twenty, most of which were thoughts I had while reading books/newspapers. Through some combination of receiving feedback during the thesis prep class, reading academic studies on the topics, and asking myself questions about how I'd test any of them I eliminated everything on my list.

I then tried to search for ideas elsewhere. I looked through the academic journals the library subscribes to. This was a mistake. Most of these articles say nothing exciting (even in the big name journals) and with most pushing 50+ pages, they take *a lot* of time to read through. Also, unless you're comfortable with high level math, the complexity is sometimes too much.

Better places to look are newspapers and magazines. Hal Varian, a famous microeconomist, says that he got most of his fresh ideas from reading newspapers (including sections like the classifieds) and trying to make sense of trends he noticed. You shouldn't just gravitate to the business/economics section of a newspaper/magazine stand. Reading Paul Krugman's column will make you smarter (it will), and may introduce you to some new interesting topics, but most of the stuff that he – and every other economics writer – talks about is established. It will be hard to think of anything fresh to say about that. [Hal Varian has a paper on how to build economic models that's good ([click here](#)). Big-wig Peter Diamond also has something about finding research topics ([here](#)) but his is less helpful. There are probably a bunch of others out there if you just search for them.]

I didn't finalize my topic until Thanksgiving break, and for that I turned to the best source: professors! You should have a pretty good idea of what your professors' research interests are. Talk to them about what yours are and ask them if they have a suggestion.

My topic was the spillover effects of fiscal policy from one country to others. The paper used Vector Autoregression (VAR) analysis, which is a special type of regression for using multiple time series and trying to account for their interdependencies. The countries I considered were the US, Mexico, Canada, Germany, and Australia (more on why I chose these countries later). Basically, I used VARs to see things like how output in Mexico would respond to an increase in government spending in the US.

I didn't know anything about what VARs were when I decided on the topic, so I needed to learn that. The TCNJ library is really lacking in economics textbooks. Most of the textbooks that are in there have the, "old smell" when you open them. This is especially true of books on econometrics, where a lot has changed recently. Still, your professor may have texts on what you need (mine did) and also, there is *a lot* on the internet, especially on college websites. Anyhow, I spent some time figuring out what VARs were, and then did an initial lit review before winter break. I say initial because as I went on I had to keep reading more and more to make sense of what I was doing. When I was doing the lit review it helped me to check the bibliographies of what I was reading. A lot of the articles I read would cite the same few "seminal" papers on the topic. These papers are usually broader, and this can help since some of what you'll read is so specific that it will be hard to see how to apply it to your work.

Now on to why I chose the US, Mexico, Canada, Germany, and Australia... Originally I wanted to choose countries that had close economic ties, as this would be more likely to show whether spillovers exist (if they don't exist for closely tied nations, why would they for anyone else?). As an example, for

Mexico the US and Canada are large trading partners. Therefore, you'd expect that if expansionary fiscal policy was pursued in those countries, it would have some positive effect on output in Mexico. I was told that my study would have more robust results if I had a larger data set, i.e. included more countries. Finding data for other countries was a pain. The data I was looking at had to be inflation adjusted and quarterly, which is surprisingly difficult to find, even for developed countries. And this is why Germany and Australia were included; they had the data (also, they're pretty significant economies, so not terrible to include). Something I wish I thought of: if you're having trouble finding data but know of another study that used the same data you're looking for (or something similar), try contacting the person who wrote the study. Most academics are congenial about helping one another and their contact information is easy to find.

In terms of dates when I finished certain tasks...ugh...is, "later than I should have", a date? At the time, I was balancing the thesis with four other classes, and a senior capstone in another major. Too much. Also, deciding on a topic so late, and then having to learn so much new material for it was rough. As an example of where I was and when, I ran regressions and found my results in the days before the Ursinus presentation. I started to make my powerpoint for the presentation *an hour* before we left TCNJ for Ursinus (seriously). Thankfully there were only six people in the room when I presented, and I was able to use confusing enough language that they weren't sure what to grill me on during questions and answers. [Don't be afraid about presenting at Ursinus. It's a chance to have fun and share what you worked on. No one in the audience grills anyone. Most of the other kids there are scared (or sleeping). No one's thesis grade is made or destroyed there, either.]

About my results... they were pretty inconclusive. For a few countries, there was evidence of fiscal policy having spillover effects (Mexico, Australia), while for the others there was either no evidence, or not enough to conclude anything. This is a little disappointing, as you're hoping that your results will be a clean confirmation of your hypothesis, but there is no shame in inconclusive results. A lot of things in economics are unclear. Also, it's better to have inconclusive results than to manipulate your data in such a way as to get results, and then cover up all the uncertain results.

Between the Ursinus presentation and the Celebration of Student Achievement I wrote my entire thesis. This is a lot of work, but I'm fast writer, and once you've done a presentation on something it's easy to write about it (although it's certainly better to write about something and then do the powerpoint about it).

The Celebration of Student Achievement was a little bit of a disappointment. I was the first to present (actually there was another presentation at the same time in another room). There were a total of *four people* there to see me present: my advisor, two other professors (one of whom fell asleep during the presentation), and the student who presented right after me. This was a shame, because I was sharp for this presentation and proud of my work. I think the economics department should revise the way they do this to encourage a better turnout. For example, the math department does their capstone talks in the lunch periods (11:20-12:30) during the last few weeks of the semester, with 2-3 students presenting each day. Faculty are encouraged to attend, but so are students – including underclassmen. The talks get 20-30 people, lively Q&A, and actually make you feel like you're holding a lecture.

Overall, I really liked the thesis project. I learned more than I did in ~~most~~ any of my classes, and really liked what I was working on. Also, at the end, the feeling of accomplishment is super. I wish I started

earlier; it sucks spending “senior nights” in the library trying to figure out why SAS won’t work. Otherwise the thesis was super. I know the econ department allows students to do “independent study” in economics as an elective (although I don’t know anyone who did it), and the thesis made me wish that I had done one of those earlier in college.

Pick something you’re interested in – even if it’s difficult, work hard – it’s the last thing you’ll do so make it good, and **have fun!** 😊

Alex Durante

Personal Timeline

I began searching for a thesis topic during the fall semester of 2011, as part of the Thesis Preparation course. I encountered multiple difficulties during this process, and switched topics several times before finally settling on one early in the spring semester of 2012. Some of the problems I faced were that I either selected topics that had already been investigated multiple times, or ones that would require data that was not available because they had never been investigated. I would advise students to find a topic that has a substantial body of published research and accessible data, but provides an opportunity to approach the topic from a fresh and interesting angle. Alternatively, students might also want to search for studies that would benefit from improvements in the research design and data construction, even if the angle remains the same.

I wrote the introduction and literature review of the thesis during the winter break of the fall semester. I found this to be one of the least stressful aspects of writing the paper, since this merely requires the ability to summarize the relevant findings of other research. I spent the spring semester compiling data and running regressions, which proved to be quite time-consuming. While some of this data was easily accessible, it often required formatting and reorganization to ensure its compatibility with STATA and my statistical model. Additionally, it was not always clear what STATA commands would yield the desired results. Though I did notice that only a rudimentary understanding of regression analysis is needed to complete the thesis, I would have preferred if the econometrics class I had taken the previous year had been focused more on the application of the concepts that we learned. For instance, it would have been helpful to learn how to control for autocorrelation in a fixed-effects model using STATA.

Though I am somewhat embarrassed to admit this, I did not complete the thesis until the spring of 2013. I strongly encourage to students to plan wisely so that they finish their thesis upon graduation. I would have much rather completed the thesis sooner than have this looming obligation. Writing the data analysis and conclusion sections of the paper are not terribly difficult once you have learned how to use STATA. Overall, I found managing my time more challenging than actually writing the paper.

Nick Falcone

Thesis Report

Timeline and Details

Topic and Literature Review

My ultimate topic was inspired by an HBO documentary I watched the summer before senior year. I ended up having two ideas, but choosing one by the middle-end of the fall semester. I started the literature review around then and finished it two days after the semester ended. I would advise against that.

Data

I began looking for data toward the first or second week of the spring semester. I got lucky and did not have much trouble finding what I needed but I had enough time to accommodate a longer, more tedious search (which I hear is more typical). I had a complete dataset at some point in late February or early March and started running regressions about one week later. I did a logit transformation of my dependent variable because it was a proportion. Transformations, to me, are not as intimidating as they seem – just some time and a few maneuvers in Excel. Be able to explain why you used the transformation you used (if one was necessary).

I had some results to present at Ursinus. Make sure you do as well, because presenting a paper without at least initial results is sort of embarrassing. It's also helpful in terms of time. The two weeks after the conference will be very hectic if they contain all of your data analysis. My presentation at the Celebration of Student achievement contained my final results. I still needed to interpret them in the paper afterward, but the Stata work was complete.

Final Thoughts

“Start early” is a big cliché, but it's true. Give yourself the time to do things the right way. In terms of *how* to do things the right way, I would suggest thinking deeply about what you want your model to say. Think about the relationship you're testing and what measures, structure, controls, etc. make the most sense. Make it as complete as possible (within reason) and try different things. If I could have done one thing differently it would have been to use more controls and not use two of the variables that ended up in my final model.

The thesis is a big undertaking but also a great opportunity to make a contribution and communicate your point of view. If you think of it more in these terms and less as an obligation, everything should fall into place.

Scott Francis

Thesis Process Summary

I started the Thesis process in the fall of 2011 with my Thesis Preparation Class. After attending the first couple of classes I had an idea of what I wanted the subject of my thesis to be. I started to skip the Thesis Prep classes, because I thought I was done my thesis prep since I had decided on a topic. I put my thesis on the back burner and concentrated on my other classes and work thinking I could just write my prospectus really quickly before the end of the semester. This was a big mistake! I put it off until the end of the semester and then realized that finding sources that apply to my topic wasn't very easy. I was then dealing with finals, work, and trying to scramble and find sources for my literary review. This led to me throwing together a bad literary review with some sources that weren't very strong, and I had to rewrite my prospectus to better reflect my topic and data. The semester was over so I had to spend my Christmas break doing all of the work I should have been doing during the fall semester. This is not something I recommend doing and it just weighed down all me all break thinking about how I was behind and not finished. "What if I don't graduate?" is constantly running through your head and it's not a fun thing to think about.

I then started my Thesis class in the spring of 2012 after working all break to catch up with my classmates. I decided to get proactive this time and looked up a bunch of data that I thought would work for my topic. Thinking I was ahead of the game and that I only had to run some easy regressions now I put my thesis on the back burner and concentrated on my classes and was needed at work more. The end of the semester came around and I was just getting started running my regressions. I really looked hard at my data and realized that my data didn't match up. I was in a horrible situation. I ended up having to find all new data and I was supposed to be done my thesis already. Everyone is talking about their jobs and what they are going to do after graduation, and I was thinking I still don't have all my data for my thesis. I may not graduate on time.

I ended up not graduating in the spring of 2012. I didn't finish my thesis on time and had to finish it over the summer. This prevented me from really looking for jobs and starting my life after college because I had this huge thing hanging over my head. I ended up doing the work that I should have done in the spring while I was supposed to be graduating having a good time. I eventually finished my thesis by the end of the summer, and now I can pursue my career 3 months after expected. Finally finishing and graduating is the greatest feeling ever. You want to do it on time and you want to do it worry free. I wish I could go back and just get all of the work done in the fall of 2011 because if I would have had everything planned out and ready for my thesis class, then it really wouldn't have been that hard or stressful. I made it much harder on myself than it had to be all because I thought I could get it done in a couple of weeks. THIS IS NOT THE CASE! You are going to run into problems and you are going to have to change things during the process of writing your thesis. It is time consuming and should be taken very seriously. I did not and paid the price.

I began my senior year with two broad ideas for topics to explore for my thesis. One was the consequences of private, profit-driven ownership of corporations, which I got the idea from reading about Richard Wolff's *Democracy at Work* over the summer. The other was the effects of mass incarceration in the United States, which I became interested in following an independent research project I did about the war on drugs the year prior. I quickly decided to pursue the latter option because I felt acquiring tractable data and getting good results would be easier.

I spent the fall semester finding and reading scholarly literature on the subject, and narrowed my focus to the use of alternatives to incarceration (ATI) and their cost effectiveness. I submitted my thesis prospectus in December and then began searching for data, where I became stalled. I emailed and called numerous researchers and staffers at various research institutes and ATI institutions but none was able to share data with me on account of sensitive privacy concerns associated with data about prisoners. As late as mid-March, just before spring break, I decided to settle for using New York City's freshly launched Data Analytic Recidivism Tool (DART), which provides averaged data for a sample of defendants meeting a combination of selected characteristics. While I would have preferred more detailed individual-level data, I recognized that time was running out and this was my most viable data source. I wrote a script in Ruby to automate the submission of the form for each possible combination of the values of the variables I was interested in that were provided on the website, which yielded 85 observations.

Once the data was in place, running regressions was probably the easiest component of the thesis process - simple OLS regression with robust standard errors and frequency weights for the size of the samples returned by DART yielded highly significant results. There was no heteroskedasticity evident.

I had just enough time to prepare slides and a presentation for the Ursinus conference, which was a really pleasant, congenial experience (not at all competitive or adversarial), and where I got good feedback that greatly helped me prepare for the presentation at the Celebration of Student Achievement. After that, I had ample time to comfortably finish writing the thesis on time.

Probably the best advice I can give is that data will certainly take way longer to find and clean than you'll anticipate, and that being relentlessly persistent will pay off - don't be afraid to make phone calls (they're much less likely to be ignored than email and you'll get useful information a lot more quickly). Also, starting the fall semester already knowing the topic you want to study is very helpful as it'll enable you to focus all your time exploring that one topic instead of doing a lot of research you won't wind up using.

Katelyn Klinck

Thesis Report

Personal Timeline:

I began work on my senior thesis knowing that I wanted to pick a topic relevant to today's current economic issues. I also had found my health and labor economics courses very interesting and knew that I would like to do something regarding those topics. I narrowed my possible topics down to three choices and researched literature on those topics. I found an overwhelming amount of information on the current economic crisis, the baby-boomer generation, and their impact on retirement over time. I was able to narrow in on this topic around the end of September.

I worked on my literature review, mainly gathering research, throughout the first semester. I was able to submit a written copy of my prospectus before winter break. During winter break I edited my prospectus based on Professor Naples comments and began to gather data. The data gathering took much longer than expected. I kept thinking of new variables that would benefit the model and then would at times find collinearity between the variables and would have to decide which to keep in the model. I started running correlations and graphing the data around the end of February in order to interpret the data I was gathering.

By the beginning of March I began to run my regressions, which led to more data gathering in order to correct for problems I saw when running the regressions. Based on the new data, and new findings, I had to re-run various regressions with different data. I also had to log the data and take the first difference in order to correct for heteroskedasticity and stationarity issues. I spent a total of 3 weeks running the regressions before I began to write the paper. It took 3 weeks because I had to re-learn some parts of econometrics and learn about stepwise regressions and STATA for the first time.

I began to write my paper around mid-March, finishing around the second week of April. Writing the paper pushed me to think more about the data and I realized problems I was having and what other data I would have to find and other tests I would have to run to fix these problems. Because of the problems I realized while writing the paper I only had some significant results to discuss at Ursinus, but I also had an idea of what was necessary to achieve my desired results. I was able to present these new findings at the celebration of student achievements at the end of April. After the celebration of student achievements presentation I had minimal writing and regressions to run. The few things I added to my paper were mainly based on suggestions from my presentation.

Knowing what I know now, I would attempt to do more of the writing for my prospectus (I focused a lot on researching and saved the writing for the last month) and gathering actual data (with correlations and graphs) in the first semester. My data gathering took the longest and left me less time to write the actual paper since it trickled into the second semester. I recommend that anyone working on their thesis should try to have a fully edited literature review and data with graphs and correlation matrixes by the end of the first semester so that you can focus on running regressions and writing the rest of the paper during the second semester.

Jordan Mojka

Thesis Overview

Unlike the majority of the other senior thesis students, I began my thesis at the very end of my junior year. While I would suggest beginning the thesis as early as possible, I needed to begin and complete my literature review (the portion of the thesis that is normally completed in Fall semester of the senior year) so I could write my thesis during the first semester of my senior year in order to be considered a full time student during my J&J co-op. As a result, my experience was very different than other students in that my experience was very independent and separated from the remainder of the seniors.

When I began the thesis my junior year, I originally wanted to focus on Economics of Law. However, after spending the next month and a half trying to find research on the topic that was experimental proved to be fruitless, I decided to change my topic to a project I worked on during a finance co-op I had in the beginning of that summer. During that project, I was asked to analyze the impact of different macroeconomic variables on the company's revenue. I found the topic extremely interesting and wanted to see if I could determine a revenue-forecasting model for a particular company. Thus, in the beginning of August I began to researching the topic. However, it was also extremely difficult to find research for my new topic. After a month of research, I found that no study had been done that created a revenue-forecasting model for a specific firm with macroeconomic variables. Instead, I needed to focus on studies that used macroeconomic variable to forecast macroeconomic events and focused on consumer consumption habits. I was able to finish my initial literature review by the very beginning of September.

Once my literature was finalized with Dr. Naples (approximately middle to end of September), I began looking for my data. I mainly use the Bloomberg terminal for my data in order to find Walmart's quarterly revenue and the multiple macroeconomic variables. However, finding my data was slightly difficult in Bloomberg simply because I had never used the terminal before. I was able to begin running a correlation matrix and regressions by the end of October. My regressions were relatively simple in that I only needed to correct for autocorrelation, which required me to use the "prais" command in Stata instead of regression command.

Since I wrote my thesis in the Fall semester, I had my entire thesis to present at both Ursinus and the Celebration of Student Achievement. While it was nice to be done with my thesis at that point and able to present the completed project, it would have also been nice to go back with the suggestions from both audiences and improved my thesis.

If I was able to re-do my thesis, I would have made myself more disciplined last summer when I was finding research for my literature review. It was extremely difficult managing two different internships/co-op's and working on the thesis after work, however, I believe that I could have completed the literature review earlier, and thus would have made more time to find data and run regressions, and thus determine a more complete model.

Overall, I would suggest that anyone working on his or her senior thesis should begin as quickly as possible simply because more time will enable them to look into additional findings that are presented by the final models.

AnnMarie Pino

Thesis Report

The topic I chose was on the non-genetic factors that influences the onset of type 1 diabetes. I did not take me long to come up with topic and I had this idea about one month into the fall semester. The literature review took approximately the rest of semester to research and write. Personally, I created a survey in order to collect data and this took about two months to construct and gain IRB approval. My survey was approved on February 16 after being submitted on February 13 in which I was given an expedited review. After spring break I had all of my data.

I began running regressions and writing about my theory and methods shortly after this. Regressions always take longer than you think so I would have liked more time to do this. Since my dependent variable was binary I ran a probit regression. Other tests to keep in mind: stepwise, heteroskedasticity, and correlation matrix. Although the time crunch was close, I had good data and results to present at the Ursinus conference. Afterwards I did run some additional tests before the second presentation at Student Achievement day. After this time I had a lot of editing and writing still left to do.

Some advice would be to think of your topic early and to have your literature review finished before Thanksgiving. Because of this, you can start collecting your data over winter break and then start running regressions at the beginning of the spring semester. Most importantly, utilize your professors. Talk to your past economic professors whose class you found interesting. All of them are more than happy to help and you never know what will trigger a topic idea. Be open to suggestions because once you are immersed in a large project such as this, it can be easy to miss things. Most importantly, choose something you are truly interested in because you are working on this for a year.

Jimmy Shaw

Thesis Report:

-Senior Thesis Prep: November and early December was when I spent most of my time research on my topic. I looked for articles and data. Since I was working with 3rd world countries, it was a nightmare trying to find economic data earlier than the late 1990s (Asian financial crisis). The World Bank had data 1.5 years behind the current date which drove me insane when talking about the most recent recession (2008).

-Senior Thesis (spring): My experience with writing and planning a thesis was terrible. There was little education on tips and tricks for writing a thesis. I was lucky in taking econometrics as a junior, but for these students taking it as a senior, they must of had a huge learning curve. I ran a typical regression and used vif and hettest commands.

-Presenting: I feel presenting at Ursinus and at Student Achievement should be optional. If the student wanted to share his/her work, they should have the option to. Also, if they are running behind in research and writing, this automatically causes the econ department frown upon those students. It should not be counted as a grade and honestly, we are seniors in college, we know how to field questions, we don't have time between finishing up other projects and finding jobs to be wasting our time talking to others in academia (no offense).

Overall: I understand the thesis is independent, but there needs to be some structure. I felt overwhelmed, did not feel valued as a student, and had anxiety because I was outside of my comfort zone with no one to be there for me.

I was given an incomplete and my final version was submitted the first week in June (grade still pending).

I hope this helps.

Alysson Wong

Thesis Report

Choosing a Topic

I began thinking about my thesis topic as soon as the fall semester began. I wasn't too sure what my topic was (obesity) until I began doing another project in my Global Public Health class which wasn't until mid-November. I then proceeded to do the basic Prospectus (Intro, Literature Review, and data sources) which I handed in, in early December. Looking through the literature I discovered the usual factors people associate with obesity (fast food consumption, not exercising, socioeconomic status, etc), and chose to see which the major contributor was by looking at several countries. Upon reading the prospectus, however, Dr. Naples advised me to expand my research and further my thesis since it may not be as challenging a feat as I anticipated. After exploring some more, I finally decided to include antibiotic consumption, the use of antibiotics on livestock, as well as confectionary consumption. I handed my complete Prospectus early January.

Data Collection and Running Regressions

Beginning the first week of the semester, I met with Dr. Naples once a week to discuss my data collection and the progress I was making. The data collection proved to be quite difficult, and much more time consuming than I had originally planned, especially for the more underdeveloped countries. The variables that proved to be the most difficult were pharmaceutical expenditures, motor vehicle consumption, and fast food prevalence. Eventually I was able to find the pharma data, excluding a few years, as well as one year's worth of car consumption which I chose to use as a fixed effect. For the fast food, however, I had decided to find the number of local and foreign fast food restaurants that existed in each country. Many of the local fast food restaurants did not provide their financial statements, so I was unable to measure the fast food consumption through the businesses' performance. Since there was not an exact list I had to go to each restaurant's website and count them individually using the restaurant locators. By the last week of March, I was only halfway through the number of U.S. restaurants and had to abandon the variable altogether.

Since the Ursinus Conference was fast approaching, I only had a little over two weeks to start running regressions, writing my thesis, and preparing for the conference. I ran into many complications with my results due to high correlations among the data, heteroskedasticity, autocorrelation, etc. Also, because I had panel data and due to the statistical software I was using, STATA, I had to manipulate the format of my input data that took up a lot of time; apparently the program does not like repeated years which I had due to my panel data. Due to these obstacles I had to transform the data several times (separate the data run regressions on individual effects, log the data, and take the difference in), and was not completely finished for the Ursinus Conference; though I was able to present my current results and future plans for the thesis.

After Ursinus Conference

The students and faculty that observed my presentation at the conference were extremely helpful, and provided valuable feedback on how to analyze my results. I did several more regressions following the conference and by Student Achievement day, I had completed the written part of my thesis.

What I would have done differently

While I was able to complete everything in a timely fashion, there are a lot of things I would have done differently that would have saved me a lot of time and energy. For one, I wish I could have come up with a finalized topic during the fall semester and began the data collection before Winter Break. Also, if I could have met with Dr. Naples a few times during the fall semester it would have sped up the whole process since she was an extremely valuable resource. If I had been able to do this, then I may have been able to focus solely on running regressions during the spring semester. This would have allowed me to present a lot more results, if not my complete thesis at the conference. Also, I should have done a bit more research on STATA commands before I started running regressions. That would have been much easier than searching for commands as I was working; I found looking them up quite time consuming. Overall, I just wish I had been more conscious of my time management since the spring semester comes to a close faster than one would think.
